

Automated Testing - EasySend Candidate Exercise

Hi there! Welcome to EasySend :)
Thanks for taking the time to do this exercise.

In this exercise, we'll test your astronaut skills - we'll need your assistance to test our site that books a flight to Space 🚀
Using a special booking system, we're able to book flights to space.

This is the website we'll use for booking: <https://demo.testim.io>
(Of course accessing it from your machine will not order a real ticket to space, we'll have to deploy your code to the special booking system 😊).

Part I - Implementation

We'll need you to write a test suite with Pytest to test the following website.
Use the Selenium library OR Playwright library.

Notice:
Write any tests you think is important and please categorize them (Suites can be Regression, Sanity, integration, Performance)

Please make sure to write a testing framework and not a testing script.

Part II - Questions

1. Using the code you wrote in part I, how would you load-test the environment to make sure it can handle many concurrent users?

Please create a git repository and share it.

Good luck!
